EXPERIMENT

Title

WEEK 1

Description

WEEK-1

AIM: Download and Install JAVA, Associate SWD Jars and Browser drivers.

ALGORITHM:

1. How to install JAVA
2. How to create and associate with SWD jars
3. How to select the browser drivers and make them to install.
4. How to convert browser drivers into .exe format.

Procedure and Overvation:

Rectangular Snip

WEEK-1

AIM: Download and Install JAVA, Associate SWD Jars and Browser drivers.

ALGORITHM:

1. How to install JAVA
2. How to create and associate with SWD jars
3. How to select the browser drivers and make them to install.
4. How to convert browser drivers into .exe format.

Install Java on Windows 10

After downloading the installation file, proceed with installing Java on your Windows system.

Follow the steps below:

Step 1: Run the Downloaded File

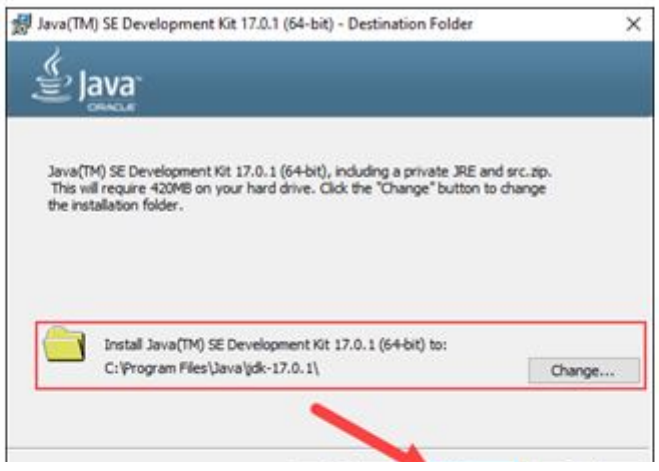
Double-click the **downloaded file** to start the installation.

Step 2: Configure the Installation Wizard

After running the installation file, the installation wizard welcome screen appears.

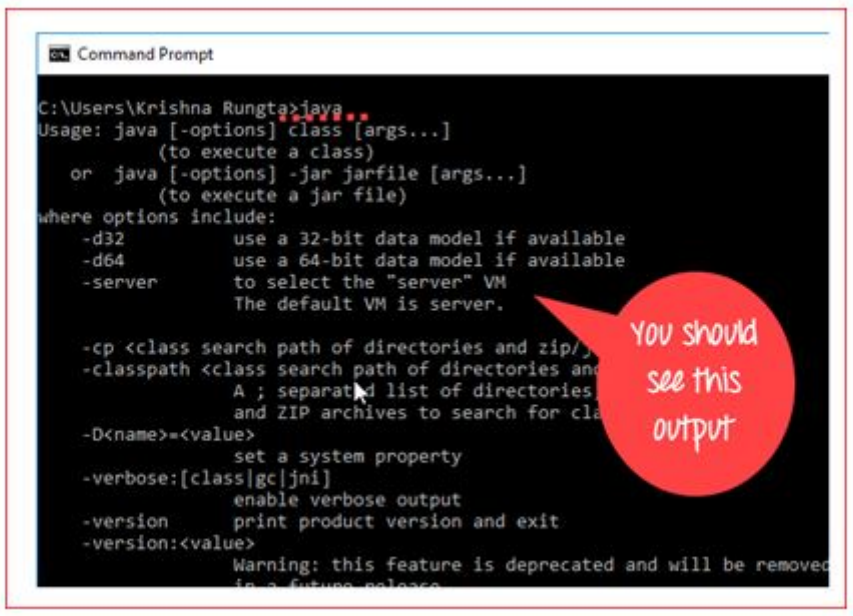
1. Click **Next** to proceed to the next step.

3. Choose the destination folder for the Java installation files or stick to the default path. Click **Next** to proceed.



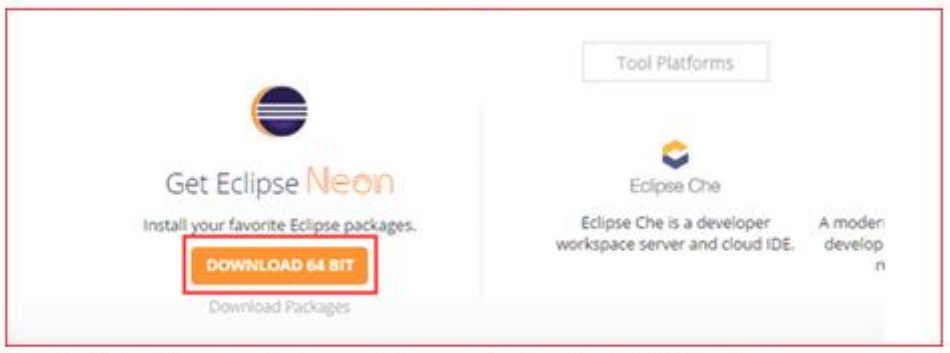
5. Wait for the wizard to finish the installation process until the *Successfully Installed* message appears. Click **Close** to exit the wizard.

Once installation is complete, open command prompt and type "java". If you see the following screen you are good to move to the next step

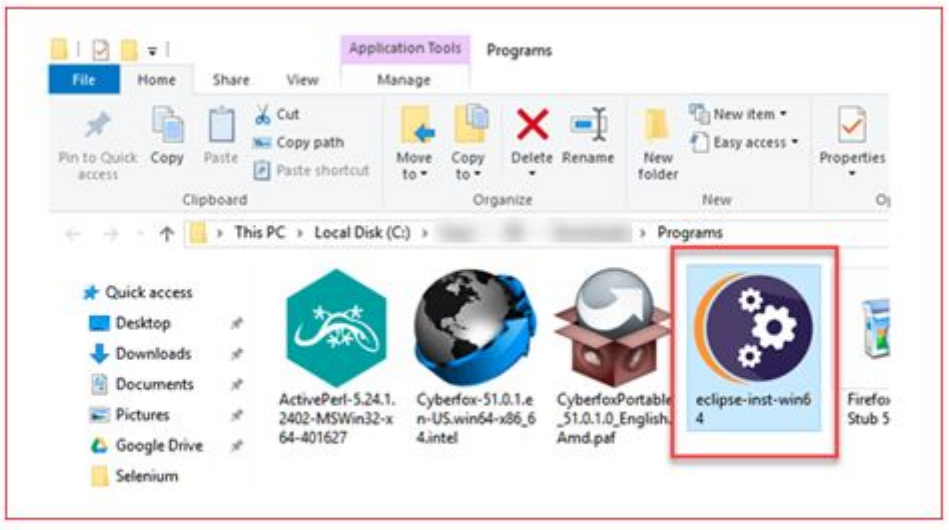


Step 2 – Install Eclipse IDE

Download latest version of **"Eclipse IDE for Java Developers"** here. Be sure to choose correctly between Windows 32 Bit and 64 Bit versions.



You should be able to download an exe file named "eclipse-inst-win64" for Setup.



Double-click on file to Install the Eclipse. A new window will open. Click Eclipse IDE for Java Developers.

After that, a new window will open which click button marked 1 and change path to

"C:\eclipse". Post that Click on Install button marked 2

After successful completion of the installation procedure, a window will appear. On that window click on Launch

This will start eclipse IDE for you.

Associate SWD Jars : [selenium web driver]

Selenium Server (Grid)

The Selenium Server is needed in order to run Remote Selenium WebDriver (Grid).
Selenium Grid allows the execution of WebDriver scripts on remote machines (virtual or real) by routing commands sent by the client to remote browser instances. It aims to provide an easy way to run tests in parallel on multiple machines.

Selenium Grid allows us to run tests in parallel on multiple machines, and to manage different browser versions and browser configurations centrally (instead of in each individual test).

Purposes and main functionalities

Purposes and main functionalities

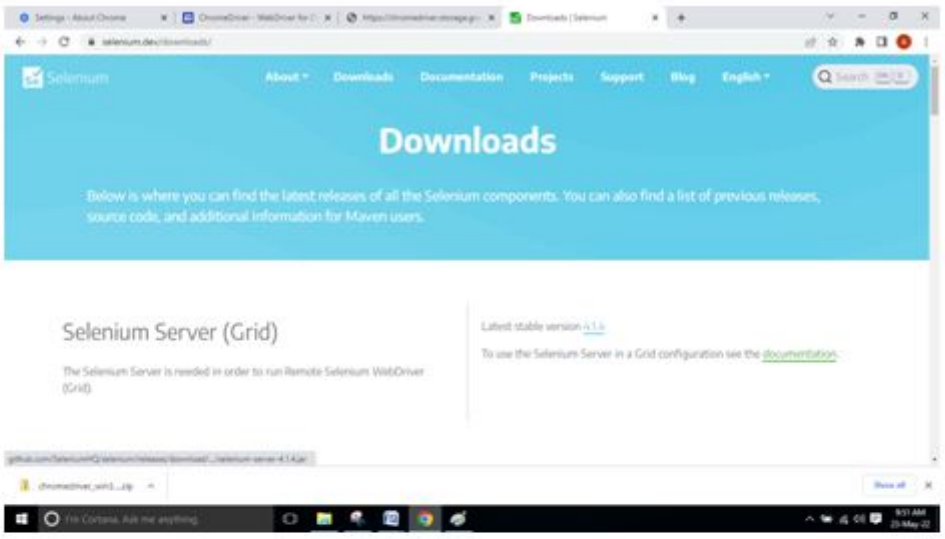
- Central entry point for all tests
- Management and control of the nodes / environment where the browsers run
- Scaling
- Running tests in parallel
- Cross-platform testing
- Load balancing

Selenium Grid 4

Grid 4 takes advantage of a number of new technologies in order to facilitate scaling up while allowing local execution.

Selenium Grid 4 is a fresh implementation and does not share the codebase the previous version had.

// Latest stable version 4.3.0



Browser drivers :

Install browser drivers

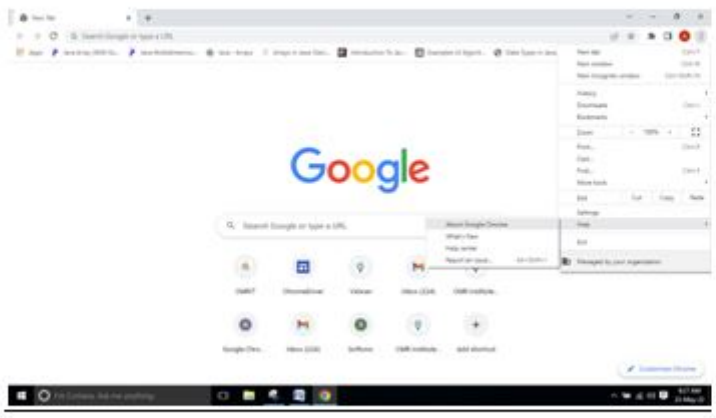
Setting up your system to allow a browser to be automated.

Through WebDriver, Selenium supports all major browsers on the market such as Chrome/Chromium, Firefox, Internet Explorer, Edge, Opera, and Safari. Where possible, WebDriver drives the browser using the browser's built-in support for automation.

Since all the driver implementations except for Internet Explorer are provided by the browser vendors themselves, they are not included in the standard Selenium distribution. This section explains the basic requirements for getting you started with the different browsers.

```
System.setProperty("webdriver.chrome.driver","/path/to/chromedriver");
ChromeDriver driver = new ChromeDriver();
```

STEPS TO INSTALL CHROME DRIVER :



Google Chrome
Chrome is up to date

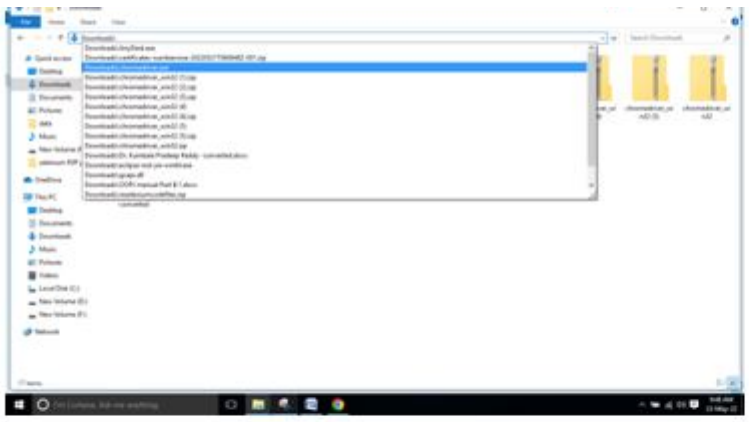
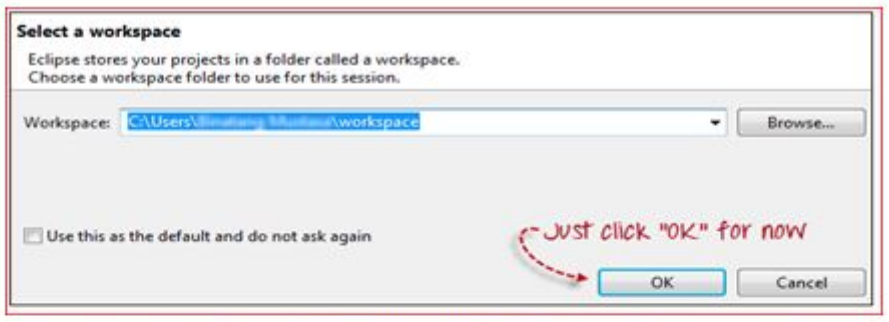
Extract Compressed (Zipped) Folders
Select a Destination and Extract Files
Files will be extracted to this folder:
Browse...
Show extracted files when complete
Extract
Cancel

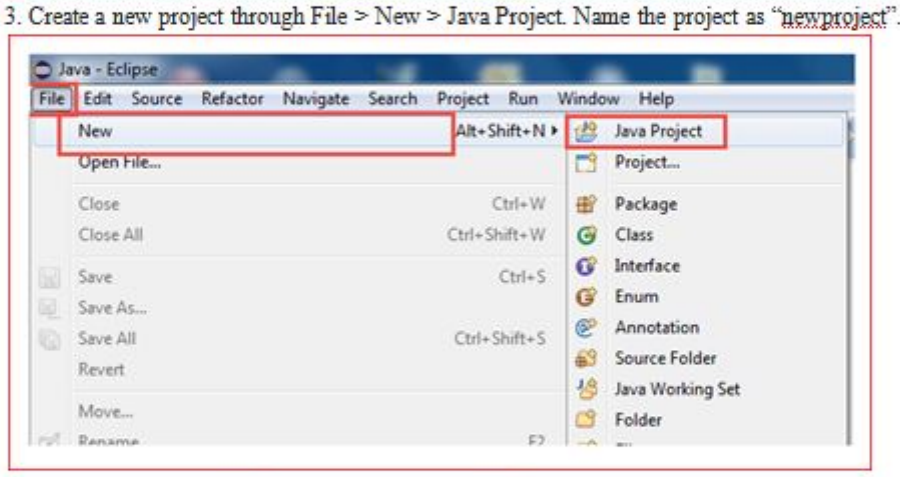


Configure Eclipse IDE with WebDriver

1. Launch the "eclipse.exe" file inside the "eclipse" folder that we extracted in step 2. If you followed step 2 correctly, the executable should be located on C:\eclipse\eclipse.exe.
2. When asked to select for a workspace, just accept the default location.

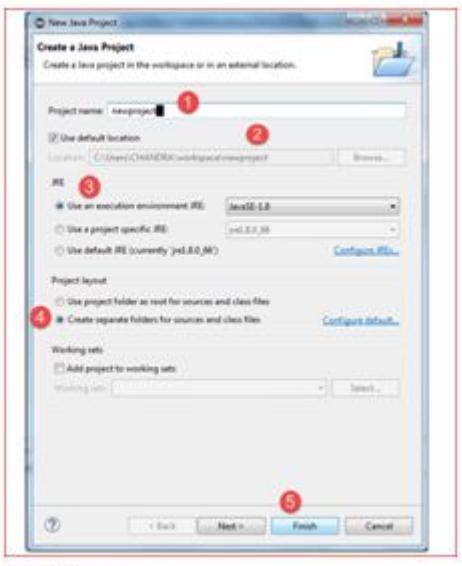


3. Create a new project through File > New > Java Project. Name the project as "newproject".



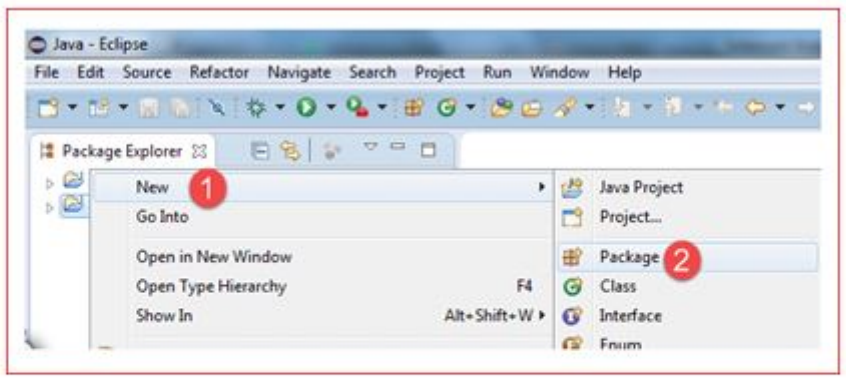
A new pop-up window will open enter details as follow

1. Project Name
2. Location to save project
3. Select an execution JRE
4. Select layout project option
5. Click on Finish button



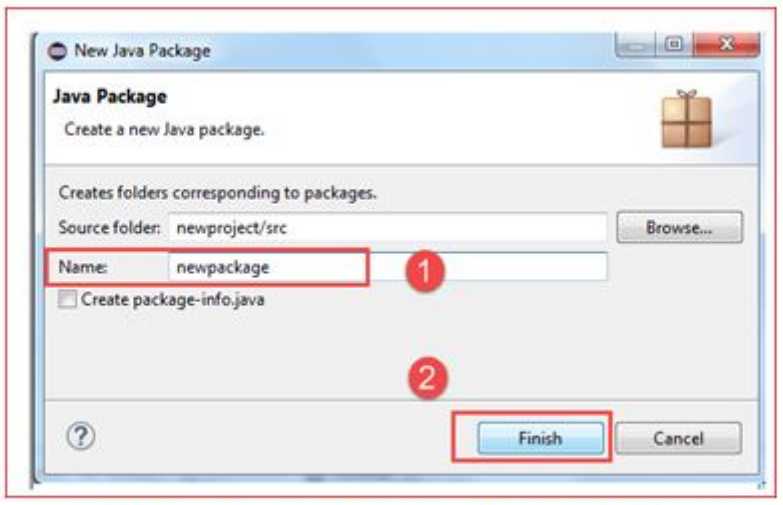
4. In this step,

1. Right-click on the newly created project and
2. Select New > Package, and name that package as "newpackage".

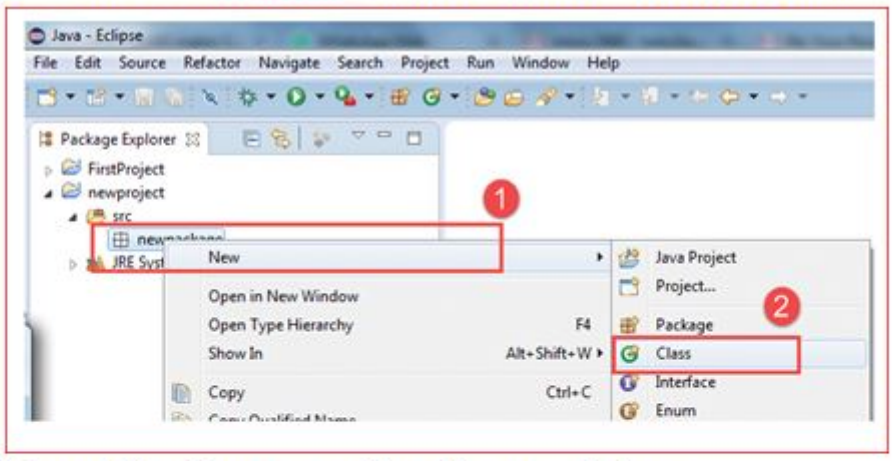


A pop-up window will open to name the package,

1. Enter the name of the package
2. Click on Finish button

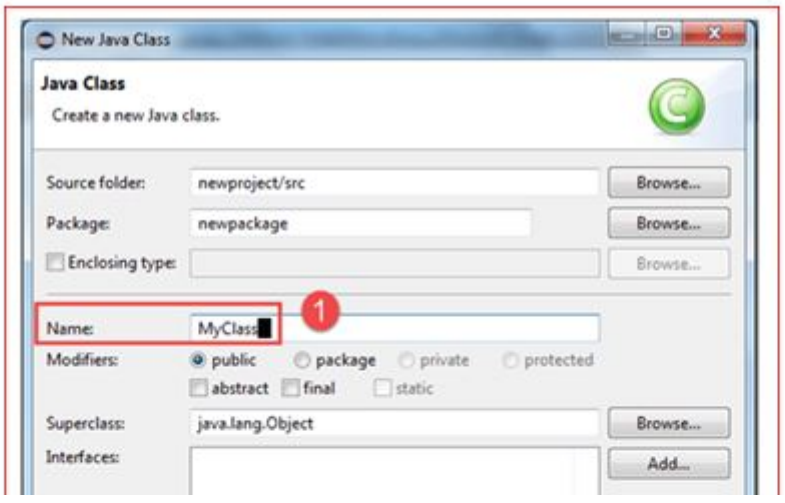


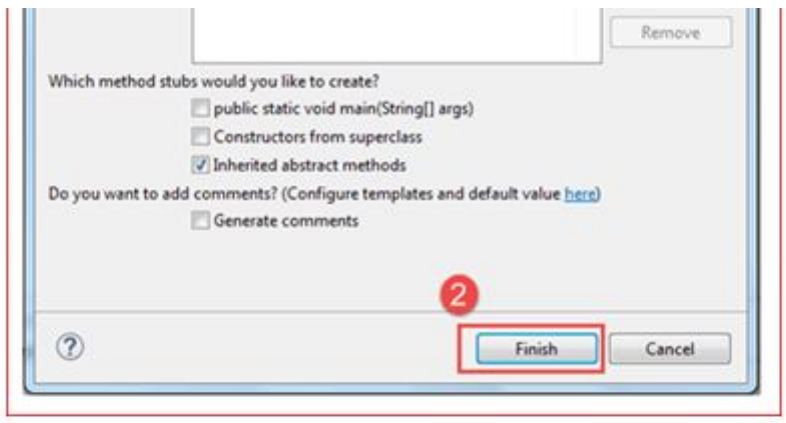
5. Create a new Java class under newpackage by right-clicking on it and then selecting- New > Class, and then name it as "MyClass". Your Eclipse IDE should look like the image below.

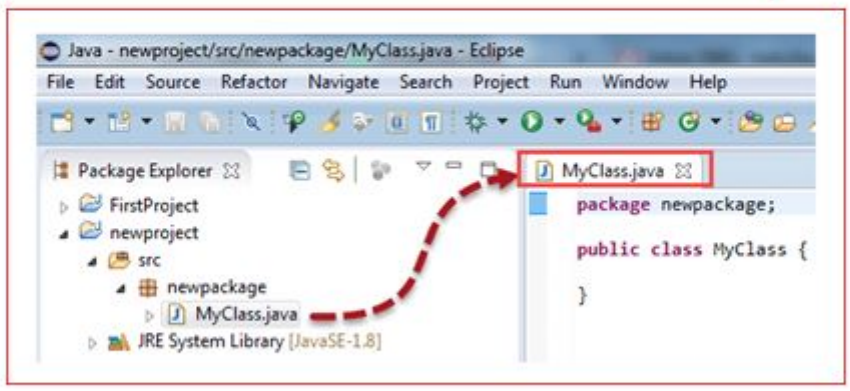


When you click on Class, a pop-up window will open, enter details as

1. Name of the class
2. Click on Finish button



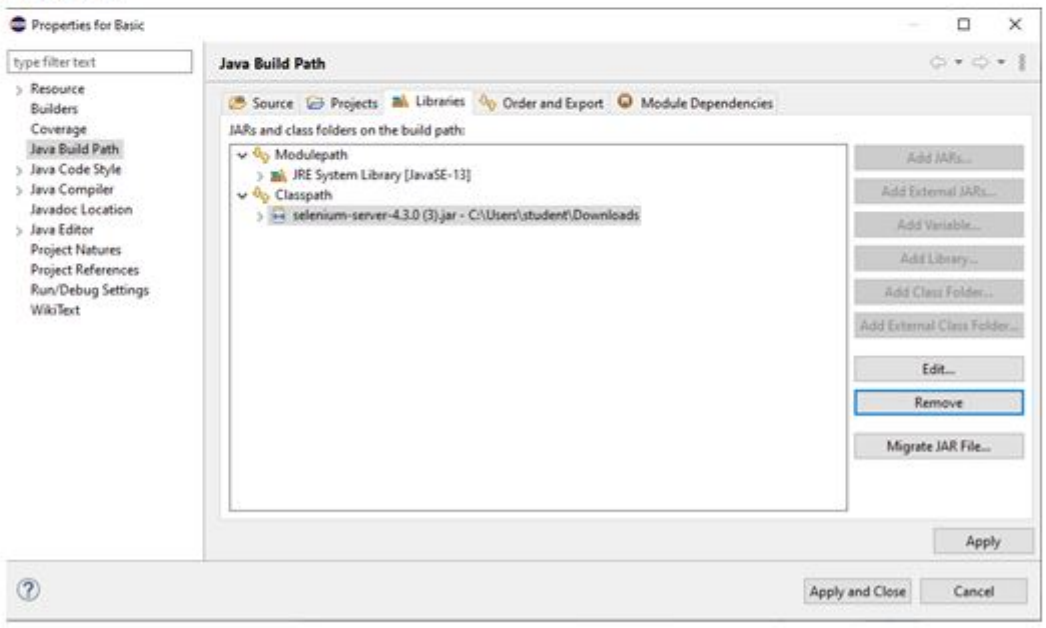




Now selenium Server jar file into Java Build Path
In this step,

1. Right-click on "newproject" and select **Properties**.
2. On the Properties dialog, click on "Java Build Path".
3. Click on the **Libraries** tab, and then
4. Click on "Add External JARs.."

When you click on "Add External JARs." It will open a pop-up window. Select the JAR files you want to add.



VIVA RESPONSES

Q) Select the component which is NOT part of Selenium Suite?

Selenium Web

Q) Select the language which is not supported by the selenium RC ?

ASP

Q) Is the web driver a component of the selenium?

Yes

Q) Selenium IDE stands for

Selenium Integrated Development Environment

Q) Select the OS which is not supported by Selenium IDE .

Unix
